Project 1.63: The Potential for Blockchain and Artificial Intelligence to Enhance the Transport Sector (October 2018 – March 2020)

Industry Steering Group Chair

Dr Ken Michael, AC

30th Governor of Western Australia

Western Australian Commissioner
of Main Roads (1991-96)

Core Partners

Project Partner

Project Associates

Project Overview

Advances in Artificial Intelligence and the emergence of Blockchain Technology stand to provide significant benefits to transport agencies, travellers and associated businesses, especially for those that move early.

This project is among the first to explore the potential for these revolutionary technologies to enhance the transport sector and allow well-informed early action.

Applied Research Methodology

1. Develop a clear working understanding of the functionality of Artificial Intelligence and Blockchain Technologies.
2. Investigate what potential there is for Artificial Intelligence and Blockchain technology to be used in the transport sector.
3. Select a short list of use cases and identify risks and rewards for the transport sector to identify deep dive use cases.
4. Undertake Deep Dive research and recommend strategic approaches to implementation by research partners.
5. Identify specific policies and mechanisms to support application.

How can Ai be applied to the Transport Sector?

What is Ai?

- Rule Based vs Machine Learning
- Predictive capacity

How can it be used in transport?

- Self-Driving Vehicles
- Traffic Management
- Vehicle Behaviour
- Traffic Signal Optimisation
- Vehicle Prioritisation
- Route Optimisation
- Traffic Risk Management
- Ride-Sharing
- Fare Evasion
- Drones Deployment

Preferred Use-Cases for Artificial Intelligence

1. Identification of Network Characteristics (*including vehicle data, engineering data, and hazards*).
2. Traffic Optimisation (*including management and Signalling, interruptions to flow, predictive congestion management, based on real time conditions*).
3. Vehicle Prioritisation (*including emergency vehicles and Mass Transit*).
4. Asset Management (*including vehicles, IoT devices, lights, communications infrastructure*).

Malaysia City Brain

Created by Alibaba uses Artificial Intelligence to process data from 300 traffic lights, 500 CCTV cameras, public transport data systems to predict traffic conditions and make recommendations for emergency services routing. The 'City Brain' AI technology was deployed in Hangzhou China in September 2018 and has resulted in *'an average traffic speed increase of 15 percent, and reporting traffic violations with 92 percent accuracy'*.

How can Blockchain be applied to Transport?

- Traffic Management
- Logistics Documentation
- Global Freight Tracking
- Supply Chain Transactions
- Identification (Drivers Licences)
- Establishing Provenance
- Establishing Authenticity

- Decentralised Database
- Trust Protocol (Tamper Evident)

**Port of
Rotterdam**

Preferred Use-Cases for Blockchain Technology

1. Real Time Road User Pricing (*including charging for time of day and road type usage*).
2. Establishing Identification (*including digital drivers' licences and vehicle ownership*).
3. Enhanced Freight Tracking and Authenticity (*including real time location and confirmation of delivery*).

Key Criteria for Use Case Selection

- Level of capitalisation, maturity and uptake of technology?
- Potential for quick wins with low expenditure to catalyse efforts?
- Level of difficulty and need for external support?
- Capital and operational expenditure requirements?
- Potential for early efforts to underpin future applications?
- Level of integration required across departments?
- Potential for multiple benefits for various users and departments?
- Prerequisites for data availability, format and intervals?

Deep Dive Use-Cases

1. The use of Artificial Intelligence to **enhance Traffic Optimisation** with a focus on traffic management and signalling.
2. The use of Blockchain Technology to **enhance Freight Tracking and Authenticity**, including real-time location and confirmation of origin and delivery.

AI + Blockchain – Road User Charging

Using the location of vehicles **Artificial Intelligence** could calculate real time road user charging based on use of specific elements of the transport network.

Once calculated a **Blockchain** technology could be used to collect small payments in real time from the vehicle (regardless of driver) to supplant reduced revenue from vehicle electrification.

This system can be used to encourage or discourage vehicles entering peak congestion areas and use other preferred routes.
