- Visualization module

A computational framework for smart freeway modelling and optimization

Simulation Module

Core Functions

- { simulate microscopic phenomena
- capture macroscopic behaviour and traffic state

Simulation Module - Mathematical Model

- **Generalized car following model**

$$\frac{dv_i}{dt} = f(v_i, \Delta x_i, \Delta v_i, \alpha_1, \dots), \quad i=1,2,\dots$$

- optimal velocity model
- full velocity difference model
- full velocity/acceleration difference
- intelligent driver model
- ...

- **Generalized macroscopic model**

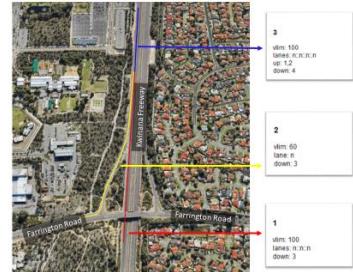

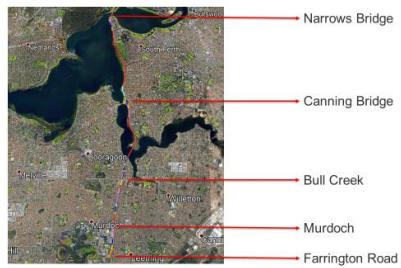

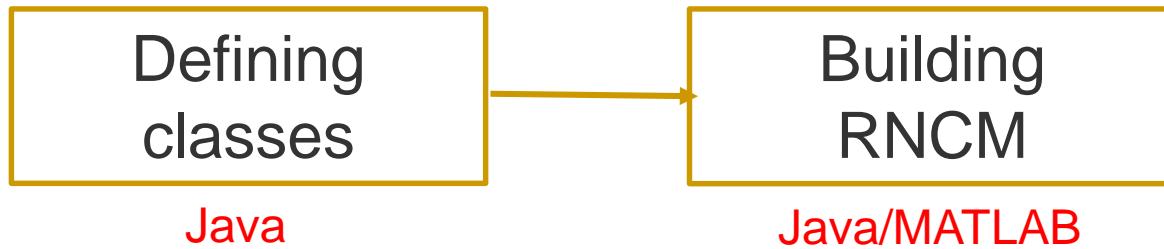

$$\frac{dv}{dt} + \frac{\partial f}{\partial x} = g(t, x)$$

$$\frac{dv}{dt} + v \frac{\partial v}{\partial x} = a \left(\rho, v, \frac{\partial \rho}{\partial x}, \frac{\partial v}{\partial x}, v_e, \beta_1, \dots \right)$$

- LWR model (the 1st equation with $f = \rho v_e(r)$)
- density gradient models (eg Payne)
- speed gradient models
- model with varying road conditions
- ...

Simulation Module – *Road Network Computer Model (RNCM)*

Create the Kwinana Fwy road network model: **From Farrington to Narrows Bridge**

Optimization Module

➤ Multiple objective function

$$J(\alpha, u) = \beta_1 J_1(\alpha, u) + \dots + \beta_n J_n(\alpha, u)$$

where $\alpha = (\alpha_1, \alpha_2, \dots, \alpha_m)$: system parameters

$u = (u_1, u_2, \dots, u_l)$: control variables/parameters

β_i : weighting coefficient

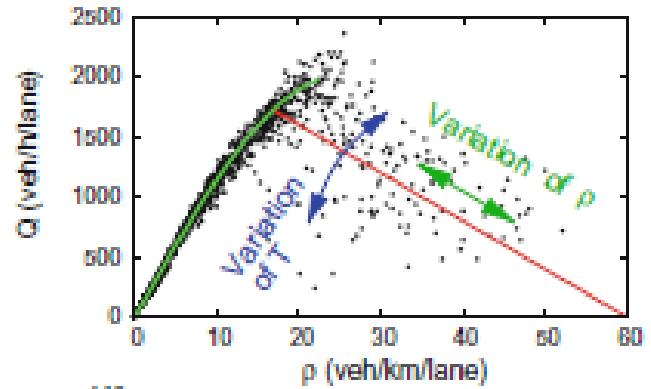

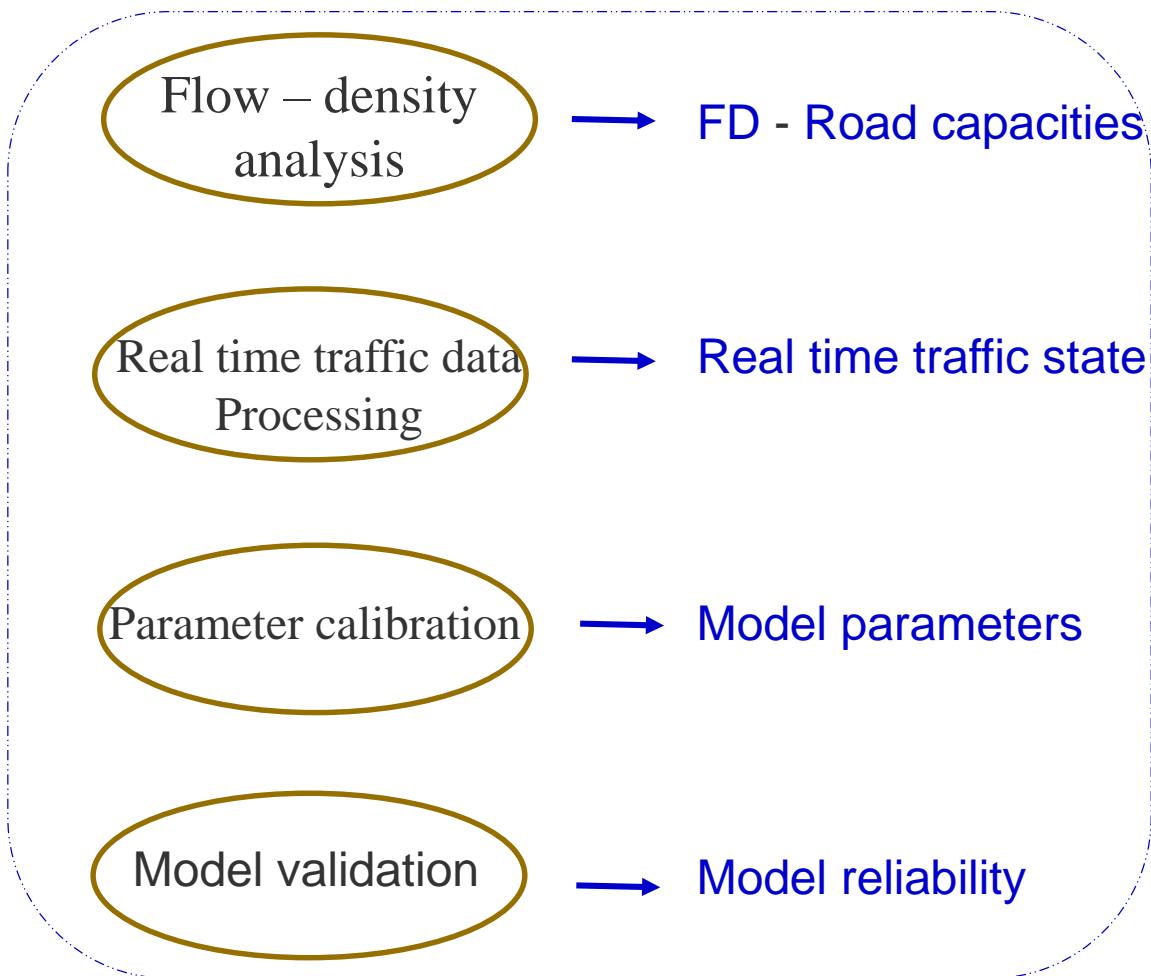

J_i : objective i

➤ Investigation problems

- Optimal strategy for maximum flow on freeways with a bottleneck
- Dynamic speed control for maximum flow on freeways under non-recurrent events
 - Closure of 1 lane
 - Reduction of road capacity
- Optimal strategy for maximum flow on freeways by real time traffic information
- Optimal strategy for maximum flow on freeways by historical data

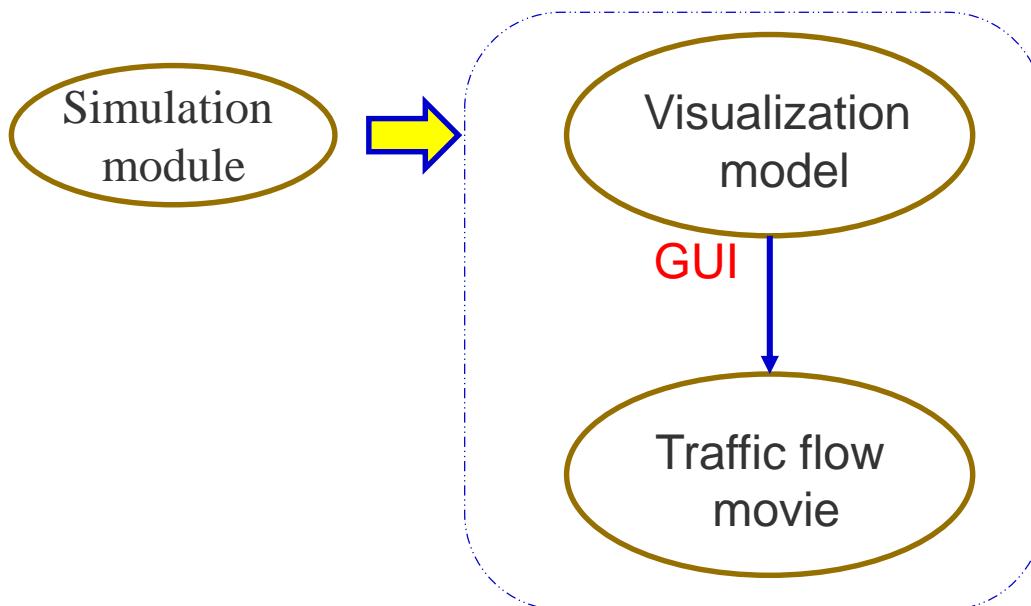

.....
